

I am opposed to granting permission to our country's power companys to use BPL technologies due to the confirmed interference generated by this technology. I have reviewed reliable test results taken from the trial/test locations here in the US and found that the interference levels are much too high. This BPL interference would severely effect my ability to receive shortwave public broadcast stations and ham radio transmissions. As a ham radio emergency services operator my ability to assist my community in times of local or national disaster would be rendered useless by the interference produced by the use of BPL. I understand utilizing this technology would also interfere with my cable TV and phone clarity.
